16-Channel Discriminator/Scaler VME Module Revision D

Jefferson Lab Fast Electronics Group Feb 11th, 2011

Overview

The 16-Channel Discriminator/Scaler Board contains 16 non-updating dual-threshold discriminators, programmable digital delays, and two 32-bit scalers per discriminator and threshold. The discriminator pulses are output as differential ECL logic levels through two front-panel headers. One group of outputs will connect to a TDC and the other group can be used as input to trigger logic. Both TDC and trigger output channels can individually be enabled/disabled with outputs widths and delays being user programmable. All programming is done through VME registers.

All discriminators and logic reside on a 6U VME64x mainboard. Each channel contains two analog receiver fast comparators (discriminator), and pulsers. Each discriminator channel has 2 programmable thresholds which can be programmed from VME. The output pulse width is also programmable from VME, but is common to the TDC and trigger discriminator channels separately. The TDC output is driven from the discriminator channel and not routed through the FPGA to minimize jitter and delays. The trigger (TRG) output is the second threshold per discriminator and is routed through the FPGA. The TRG output can be individually delayed in 4ns steps up to 1020ns and the pulse reshaped in the FPGA to provide a 4 to 1024ns pulse width. A TRG output delay setting of zero bypasses delay and pulse reshaping logic. The TRG output of the discriminator can also select which discriminator threshold source to use in the case a single threshold is desired for the TDC and TRG outputs.

Each discriminator output pulse is recorded by two 32 bit counters (scaler). For each channel an external gate (NIM) is applied to one scaler while the other scaler is free running. Scalers can be latched, read, and cleared through VME. There is a "OR" (NIM level) ouput that is the logical OR of all the unmasked discriminator outputs.

Discriminator outputs are provided as dECL levels on the front panel for interfacing with TDCs and trigger logic.

The VME64x interface is A32/A24/D32/D64/BLT32/BLT64/2eVME/2eSST with support for interrupts.

4. <u>VME Accessible Registers</u>

All discriminator board registers can be accessed through the VME bus in the following modes:

- A24: single cycle accesses
- 32bit aligned read or write access (register specific)

Event readout can be access through the VME bus in the following modes:

- A32: single cycle, BLT, MBLT, 2eVME, 2eSST
- Note: transfer rate for 2eSST is 200MB/s

Register Summary:

| Register | Description: | Address Offset-Range: |
|-------------------------|-----------------------------|-----------------------|
| A_THRESHOLD_CH0 | Threshold Control Ch0 | 0x0000 |

Analog Discriminator Control Registers

The 16 analog front panel inputs are fed into individual discriminator/pulser circuits as shown in the following figure. The registers are shown that control the features of these channels. Note that the TDC pulse width and TRG pulse width is common to all channels of the discriminator board, while all thresholds and enable masks are individually controllable for each channel.

Register: A_THREHOLD_CH0 -> A_THRESHOLD_CH15

| Add | ress Offset: 0 | | ,0x003C | | | | |

| | | | TDC Th | reshold | | | |

TDC Threshold (R/W):

TDC CHx Threshold (in -1mV units)

TRG Threshold (R/W):

TRG CHx Threshold (in -1mV units)

Notes:

 TRG threshold should be >25mV above TDC threshold (for same channel) to avoid introducing jitter onto timing sensitive TDC comparator. If same threshold for both outputs are desired, see A_TRGOUT_CHx registers to route TDC output to TRGOUT signals and set TRG thresholds out of range so they do not fire.

Register: A_PULSEWIDTH

Address Offset: 0x0080

| 1055 O11500. 0 | A0000 | | | | | |
|----------------|--------------------------------------|---|--|---|--|---|

TDC Pulser Width (R/W):

Controls pulser width (in units ns) for all TDC channels. Will be calibrated from 4ns to 40ns (~1ns accuracy). Values outside this range are not guaranteed to be calibrated.

TRG Pulser Width (R/W):

Controls pulser width (in units ns) for all TRG channels. Will be calibrated from 4ns to 40ns (~1ns accuracy). Values outside this range are not guaranteed to work.

Register: A_CH_ENABLE

| Addi | ress Offset: 0 | x0088 | | | | | |
|---------|----------------|---------|---------|---------|---------|--------|--------|
| Size | : | 32bits | | | | | |
| Rese | et State: | 0xFFFI | FFFFF | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| TRG15EN | TRG14EN | TRG13EN | TRG12EN | TRG11EN | TRG10EN | TRG9EN | TRG8EN |

TDCENx (R/W):

(0) - TDC channel x disabled (1) - TDC channel x enabled

TRGENx (R/W):

'0' – TRG channel x disabled

'1' – TRG channel x enabled

Notes:

1) A disabled TDC or TRG channel will prevent discriminator comparator and pulser from firing by using out of range thresholds.

Trigger Output Control Registers

There are 32 ECL outputs from the discriminator. The first 16 are grouped into 1 connector and are directly fed from the TDC threshold discriminators. These 16 TDC outputs are only programmable at the discriminator channel level (threshold, enable mask, analog formed pulse width). The second group of 16 channels come from the FPGA and has several programmable features as outlined in the following figure. Each bit of the 16 channel output corresponds to a specific discriminator channel (TRG Output bit 'n' comes from Discriminator channel 'n'). The TRG output can select which discriminator threshold to use: TRG or TDC. The selected source can then be fed directly to the TRG output to minimize jitter and delay. Alternatively the selected source can pass through a digital pulse width block and digital delay block. By passing through the digital width/delay sections a ~4ns jitter and additional propagation delay are added to the TRG output. Each of the 16bits are separately controllable.

Register: A_TRGOUT_CH0 -> A_ TRGOUT_CH15

| | lress Offset: 0 | x0040, 0x0044 | ,0x007C | | | | |

| | | EVT_ | WORD_INT_L | EVEL | | | BERREN |

EVT_NUM (RO):

Indicates the number of built events residing in the FIFO ready for readout.

EVT_WORD_INT_LEVEL (R/W):

Range: 0 to 16383. Sets the 32bit word interrupt threshold for the event builder. If the number of 32bit event words inside the event builder FIFO is greater-than or equal to this value an interrupt will be generated if enabled by the A_INTERRUPT register.

EVT_NUM_INT_LEVEL (R/W):

Range: 0 to 255. Sets the event count interrupt threshold for the event builder. If the number of events inside the event builder FIFO is greater-than or equal to this value an interrupt will be generated if enabled by the A_INTERRUPT register.

BERREN (R/W):

'0' – disable VME bus error assertion for end-of-event signaling (user must know event size or parse readout contents to ensure event synchronization/alignment)

'1' - enables VME bus error assertion for end-of-event signaling

Trigger threshold scaler for CHx.

Belongs to scaler group 1, which uses scaler gate 2 and latch 2 as control sources.

32bit value indicates an overflow when count is saturated (at 0xFFFFFFF).

Notes:

1) A scaler latch must be performed (by writing to register A_SCALER_GRP2_LATCH, or using event builder) to update these registers with current scaler counts

Register: A_REF_SCALER_GRP1 Address Offset: 0x0204

REF SCALER(RO):

Reference scaler, increments at 125MHz while gate source is high.

Belongs to scaler group 1, which uses scaler gate 1 and latch 1 as control sources.

32bit value indicates an overflow when count is saturated (at 0xFFFFFFF).

Notes:

A scaler latch must be performed (by writing to register A_SCALER_GRP1_LATCH, or using event 1) builder) to update these registers with current scaler counts

Address Offset: 0x9000 Size: 32bits

Notes:

1) This register is reserved for testing, calibration, and firmware upgrade use.

5. Module Performance (Typical)

Measured signal jitter:

Input: 1Vpp, 1MHz square wave with an overdrive from 5mV to 500mV, and slew rate from 10mV/ns to 1000mV/ns. The following plot indicates measured performance.

Measured slew rate dispersion:

356mV, 30ns width negative pulse. Overdrive set to 100mV, edge rate varied from 250mV/ns to 20mV/ns, pulse rate 100Hz. Roughly a 20ps dispersion with respect to slew rate measured.

Measured channel isolation:

A 1V edge with slew rate 1V/ns injected into discriminator channel. The pickup measured on adjacent channels was less than $350\mu V$ (>69dB channel-channel isolation). Yellow trace below is measured induced voltage on victim channel.

Measured maximum rates:

110MHz Rate w/4ns Output Pulse Width

6. Scaler Event Readout

Scaler event readout is performed by writing to the A_READOUT_START register with the appropriate flags set according to the user preference and then by generating a trigger from an appropriate source (either software, internal pulser, or external input). Each time a trigger is generated the internal event builder will write to the readout FIFO with the scaler event determined by the flags set. Events can be generated until the readout FIFO not longer contains enough space for a full event to be written. This guarantees that only full events are written and never partial events. The output buffer can store multiple events. Readout is performed by accessing the modules A32 VME address using any of the support VME protocols of this board.

Event Format:

The event format is compatible with the Jlab DAQ group's proposed format for Jlab DAQ modules. There are a number of redundant bit fields in the readout format for the discriminator that may be eliminated in software after readout or can also be removed in the discriminator firmware based on request.

Data Word Categories

Data words from a module are divided into two categories: Data Type Defining (bit 31 = 1) and Data Type Continuation (bit 31 = 0). Data Type Defining words contain a 4-bit data type tag (bits 30 - 27) along with a type dependent data payload (bits 26 - 0). Data Type Continuation words provide additional data payload (bits 30 - 0) for the last defined data type. Continuation words permit data payloads to span multiple words and allow for efficient packing of raw data. Any number of Data Type Continuation words may follow a Data Type Defining word.

EXCEPTION: In order to allow full 32-bit User payload data for specific modules, the User may create Data Type Defining Words (for the Data Types 4 - 13) that include the specific number of 32 bit Continuation words that follow. In this way the full 32 bits for each Continuation word may be used (and bit 31 is not required to be 0).

| | | | BUILDE | R_FLAGS | | | | | | | | |
| 7 | 7 6 5 4 3 2 1 0 | | | | | | | | | | | |
| | | | SCALE | R_LEN | | | | | | | | |

IN2:

Front panel input IN2 value at time of trigger.

IN1:

Front panel input IN1 value at time of trigger.

BUILDER_FLAGS:

These flags indicate the scaler data order that follows. Data types are prioritized in terms on the bit index: the lowest bit index in the BUILDER_FLAGS field has the higher priority which will be reported first. If the bit is '0' then scalers corresponding to that bit flag are skipped by the event builder.

- Bit 0: '1' Trigger threshold scaler group 1 are reported in ascending channel order (16 scalers)
- Bit 1: '1' TDC threshold scaler group 1 are reported in ascending channel order (16 scalers)
- Bit 2: '1' Trigger threshold scaler group 2 are reported in ascending channel order (16 scalers)
- Bit 3: '1' TDC threshold scaler group 2 are reported in ascending channel order (16 scalers)
- Bit 4: '1' Scaler group 1 125MHz reference (1 scaler)
- Bit 5: '1' Scaler group 2 125MHz reference (1 scaler)
- Bit 6: not defined
- Bit 7: not defined

SCALER_LEN:

0-255: number of 32bit scaler data words to follow directly after this header. This data type is an exception to the normal "data continuation" bit 31 indicator so that full 32bit scaler data can be accommodated.
